Evaluation & Testing

Data's 10 companies | enough for round 1: single-company and year-over-year, not same-quarter

What Eval assumes is in the DB (reproduces Data's count: 10 10-Ks, 11 10-Qs)

Company	Fiscal year ends	Latest 10-K	Latest 10-Q quarter
Apple	last Sat of Sep	FY2025 (Sep 2025)	Jun 27, 2026
Casey's	April 30	FY2026 (Apr 2026)	Jul 31, 2026
McKesson	March 31	FY2026 (Mar 2026)	Jun 30, 2026
Medtronic	last Fri of Apr	FY2026 (Apr 2026)	Jul 31, 2026
Microsoft	June 30	FY2026 (Jun 2026)	Mar 31, 2026 *
Micron	Thu near Aug 31	FY2025 (Aug 2025)	May 28, 2026 *
Nike	May 31	FY2026 (May 2026)	Aug 31, 2026
NetApp	last Fri of Apr	FY2026 (Apr 2026)	Jul 31, 2026
Parker-Hannifin	June 30	FY2026 (Jun 2026)	Mar 31, 2026 *
Take-Two	March 31	FY2026 (Mar 2026)	Jun 30, 2026

* latest 10-Q is older than other companies' (quarter ended March or May 2026)

6 months in which the ten fiscal years end: every comparison must name each period

3 calendar quarters across the latest 10-Qs: no quarter that all ten share

2 yrs per company, from each 10-K's prior-year column: year-over-year yes, trends no

0 10-K/A amendments in scope, so restatement questions (GraphRAG M12, M13) drop

Answer to Data: yes, enough for round 1. Asks: confirm the 21 accession numbers, share chunks for all 21 filings, and clean Exhibit 21 for the ten 10-Ks.

Source: Week 6/results/scope10_coverage.json, data/scope10_filings.json; fiscal periods from SEC companyconcept API (read 10/29)

Evaluation & Testing

Gold Set v1.1 | 139 questions for round 1: 90 kept, 10 retired, 49 new on the added companies

	v1 kept	Retired	New (EV2)	Round 1
Extraction	26		34	**60**
Calculation & derived	27		2	**29**
Definition & narrative	26			**26**
Cross-company	1	10	5	**6**
Fiscal calendar			3	**3**
Unanswerable & false premise	10		5	**15**
All questions	**90**	**10**	**49**	**139**

53/53 new answers re-read from the SEC API: both reads agree

18/18 Q1 + Q2 + Q3 = nine-month total, per company and line item

156/156 grader labels right on the 39 new numeric questions (exact, restated, x1000, sign)

6 relationship questions drafted with GraphRAG, all on their 5 filings this week

49 new questions wait for Data's chunks to get text anchors

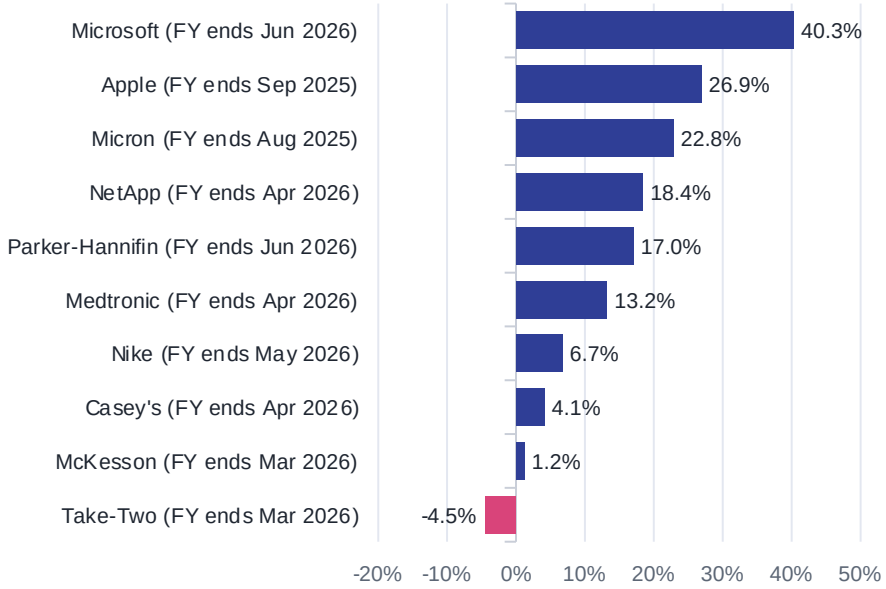

Retired: the 10 questions that need Amazon, Meta or NVIDIA. Microsoft stays the MVP (89 questions); every added company gets 3 to 7 questions, plus 5 that compare all ten.

Source: Week 6/data/benchmark_scope10.jsonl, benchmark_scope10_status.csv; results/scope10_checks.json, scope10_grader_check.json

Evaluation & Testing

Comparisons | ten companies, six fiscal calendars: a 'latest year' ranking spans Aug 2025 to Jun 2026

Net margin, each company's latest fiscal year in the corpus

Traps the new questions test

Missing year. Micron's latest 10-K is FY2025. 'FY2026 revenue' must be refused, not built from three 10-Q quarters (EV2-045).

Line-item name. Parker-Hannifin tags net income as ProfitLoss; no NetIncomeLoss facts in its 10-Ks or 10-Qs filed since June 2025.

Sign. Take-Two lost USD 298.2M in FY2026; 'why was it profitable?' is a false premise (EV2-048).

Changed tag. Nike's and NetApp's latest 10-Q revenue is not under the tag their 10-Ks use (SEC API, 10/29).

Why it matters: an agent that ranks 'latest results' without naming each period compares different years. Each comparison question states every company's period, and the scope check refuses years that are not in the corpus.

Source: Week 6/data/scope10_facts.jsonl (SEC companyconcept API, read twice 10/29); questions EV2-040 to EV2-049

Evaluation & Testing

GraphRAG | both retrieval arms now score against the same gold set as RAG, through one harness

Wired on the INT-0 mock's rows (tests the plumbing, not the graph)

87 Microsoft questions through both arms: 174 calls, 0 errors

87/87 pass all 5 checks: trace_id echoed, one provenance key, versions, fact period

27 segment-vs-total false matches now rejected: fact keys carry XBRL dimensions (an Eval bug, fixed)

6 relationship questions drafted; all use the MSFT 10-Q or FY2026 10-K GraphRAG loads

155 questions in hops_v1.csv for GraphRAG to label; Eval reviews

Findings for GraphRAG

Finding in GraphRAG's output	Ask
Fact values are in USD millions (82,886) while the unit says USD	Return the XBRL unit value, or add a scale field
Segments are labels ('Intelligent Cloud'), not XBRL members	Carry the member name; Eval matches labels for now
Two evidence rows share one section_id	One id per evidence row, so citations stay distinct

Agreed 10/26, now in code: citations join on chunk, section or fact id; reruns key on all three version fields; anchors ignore whitespace.

Next: point the harness at graphrag.retrieve once GraphRAG registers a backend; scores then measure the graph.

Source: Week 6/results/graphrag_wiring.json; kpmg_eval/graphrag_adapter.py; data/benchmark_v1_relationship_draft.jsonl, hops_v1.csv

Evaluation & Testing

Next steps | RAG's anchors reach every input for 49/50 numeric questions; one ask per team

Review of RAG's Gold v1 anchors (their PR #10)

97/99 numbers the answers use sit in an anchored chunk

2 anchors match no chunk: a share-count string from Gold v0 on two questions

33 anchors match 4+ chunks: bare numbers such as '82,886'

10 retired questions (Amazon, Meta, NVIDIA) to drop

47 rows filter on ticker + form only; add fiscal year and quarter

Asks

Team	Ask before round 1 (W8)
Data	Confirm the 21 accession numbers; share chunks for all 21; clean Exhibit 21 for the ten 10-Ks
GraphRAG	Propose hops for the 155 questions; a date for a real backend; the 3 findings on the GraphRAG slide
RAG	Fix 2 anchors, add row labels to the 33 broad ones; trace_id and cited chunk ids in the logs
Agents	Return the AnswerBlock with trace_id and cited chunk, section or fact ids
Eval	Text anchors for the 49 new questions once chunks land; human review of 8 flagged items

Where Eval stands: the harness runs RAG and both GraphRAG arms. Round 1 now waits on Data's chunks, GraphRAG's backend and the Agent's AnswerBlock.
